# SULTAN QABOOS UNIVERSITY <br> Department of Civil and Architectural Engineering <br> B.Eng. Examinations, Fall Semester 2006 

COASTAL ENGINEERING
CIVL 5076

December 25, 2006
09:00-12:00

The following is provided for this examination

1. Answer booklet
2. Design aids: formulae, graphs and charts.

Candidates are permitted to bring into the examination room
Calculator (programmable or non-programmable).

## Instructions to candidates:

1. Attempt all questions.
2. The paper consists of FIVE questions.
3. The allowed time is three hours.
4. Assume water density as $\mathbf{1 0 3 0} \mathbf{~ k g} / \mathbf{m}^{\mathbf{3}}$ wherever required.
NAME:

Date:

| Question | 1 | 2 | 3 | 4 | 5 | Total |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Marks |  |  |  |  |  |  |

1. Consider the L -shaped breakwater protecting a harbor region 6 m deep, as shown in the following figure. A record of incident waves is shown in the table below. Which wave condition results in the highest wave at point X behind the breakwater?

| No: | $H_{i}(\mathrm{~m})$ | $T$ (sec) | $\alpha$ (deg) |
| :---: | :---: | :---: | :---: |
| 1 | 2 | 54.4 | 60 |
| 2 | 3 | 27.3 | 45 |
| 3 | 3.5 | 11.2 | 90 |
| 4 | 4.5 | 6.1 | 105 |

2. A 2.4 m high wave with a period of 8 sec in deep water is propagating toward the shore without refracting. A water particle velocity of $0.25 \mathrm{~m} / \mathrm{s}$ on the bottom is required to initiate movement of the seabed particles. At what water depth the particles at the seabed will start moving as the wave shoals?
[20\%]
3. The bottom profile at a project site on Al-Batinah coast is shown as follows. If a tsunami wave with height 2 m and period 30 minutes reaches Station A at 7:00 a.m.
(a) What time will it arrive at Station B?
(b) What will be the tsunami height at Station B?.

4. If the significant wave height in a wave record is 4 m and the significant wave period is 7.5 sec . Using the properties of Raleigh distribution answer the following:
(a) How many waves would be smaller than 5 m height in a 30 minute long wave record?
[10\%]
(b) Estimate the average wave height for this record?
(c) Estimate the maximum wave height in a wave record of 1 hour duration?
5. The head of a rubble mound breakwater is to be constructed at Sohar port with a face slope of 1:2. The design water depth at this location is 7 m and the bottom slope fronting the structure is $1: 30$. The deep water significant wave height is 4 m and a significant period of 8 sec .
(a) What weight tetrapod armor units (specific gravity=2.4) are required for the head of breakwater? Note: Check if the waves are breaking or nonbreaking. [10\%]
(b) What should be the crest width according to specifications? [5\%]
(c) What will be the armor unit placement density?

The following formulae and graphs are provided.
$\eta=\frac{H}{2} \cos (k x-\sigma)$

$$
\phi=\frac{H}{2} \frac{g \cosh k(d+y)}{\sigma \cosh k d} \sin (k x-\sigma t)
$$

$\sigma^{2}=g k \tanh (k d)$ $C=\sqrt{\frac{g L}{2 \pi} \tanh \left(2 \pi \frac{d}{L}\right)}=\frac{g T}{2 \pi} \tanh \left(2 \pi \frac{d}{L}\right)$
$L=\frac{g T^{2}}{2 \pi} \tanh (k d) \quad L_{0}=\frac{g T^{2}}{2 \pi} \quad W=\frac{w_{r} H_{i}^{3}}{K_{D}\left(S_{r}-1\right)^{3} \cot \theta} \quad t_{T}=\sum \frac{\Delta S}{\sqrt{g d_{s}}}$
$u=\left(\frac{\pi H}{T}\right) \frac{\cosh k(d+y)}{\sinh (k d)} \cos (k x-\sigma t) \quad v=\left(\frac{\pi H}{T}\right) \frac{\sinh k(d+y)}{\sinh (k d)} \sin (k x-\sigma t)$
$\zeta=\left(\frac{H}{2}\right) \frac{\cosh k(d+y)}{\sinh (k d)} \sin (k x-\sigma t) \quad \varepsilon=\left(\frac{H}{2}\right) \frac{\sinh k(d+y)}{\sinh (k d)} \cos (k x-\sigma t)$
$p=-\rho g y+\left(\frac{\rho g H}{2}\right) \frac{\cosh k(d+y)}{\cosh (k d)} \cos (k x-\sigma t) \quad H_{r m s}=0.706 H_{s}=1.129 H_{100}$
$E=\frac{\rho g H^{2} L}{8} \quad P=\frac{n E}{T} \quad n=\frac{1}{2}\left(1+\frac{2 k d}{\sinh (2 k d)}\right)$
$p(H)=\frac{2 H}{\left(H_{r m s}\right)^{2}} e^{-\left(H / H_{m s}\right)^{2}} \quad \frac{H_{1}}{H_{2}}=\sqrt{\frac{n_{2} L_{2}}{n_{1} L_{1}}} K_{R}, \quad\left(\frac{H}{L}\right)_{\max }=\frac{1}{7} \tanh (k d)$
$K_{R}=\sqrt{\frac{\cos \alpha_{0}}{\cos \alpha}} \quad H_{r m s}=\sqrt{\sum \frac{H_{i}^{2}}{N}} \quad \frac{\sin \alpha}{L}=\frac{\sin \alpha_{0}}{L_{0}}$
$\Delta y=\frac{\pi H^{2}}{L}$ coth $k d \quad H=\frac{\left(1+C_{R}\right)}{2} H_{i} \quad H_{\max }=0.707 H_{\mathrm{s}} \sqrt{\ln N}$
$B=n k_{\Delta}\left(\frac{W}{w_{r}}\right)^{1 / 3} \quad r=A n k_{\Delta}\left(1-\frac{p}{100}\right)\left(\frac{w_{r}}{W}\right)^{2 / 3}$
$N_{s}=\max \left\{1.3\left(\frac{1-K}{K^{1 / 3}}\right)\left(\frac{d_{I}}{H_{i}}\right)+1.8 e^{\left(-1.5 \frac{(1-K)^{2} d_{i}}{K^{1 / 3}} \frac{H_{i}}{}\right)} ; 1.8\right\}$
$K=\frac{4 \pi d_{l} / L}{\sinh \left(4 \pi d_{l} / L\right)} \sin (2 \pi B / L)^{2}$

TABLE 3.1. WAVE DIFFRACTION COEFFICIENTS, $K_{D}$, AS A FUNCTION (WIEGEL, 1962)

| Tribar | 1 | Uniform | 12.0 | 15.0 | 7.5(1) | 9.5(1) | 1.5-3.0(8) |
| Quarrystone - graded angular riprap | - | Random | 2.2 | 2.5 | --- | -- | --- |
| (1) CAUTION: These $K_{D}$ values are unsupported and are provided only for preliminary deaign. <br> (2) $\mathbf{n}$ is the number of units comprising the thickness of the armor layer. |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
| (3) The use of single layer of quarrystone armor units is not recommended for structures subject to breaking waves, and only under special conditions for structures subject to nonbreaking waves. When it is used, the stone should be carefully placed. |  |  |  |  |  |  |  |
| (4) Special placement with long axis of stone placed perpendicular |  |  |  |  |  |  |  |
| (5) Stability of dolosse on slopes steeper than 1 on 2 should be substantiated by site-specific tests. |  |  |  |  |  |  |  |
| (8) Refers to no-damage criteria (<5 percent displacement, rocking, etc.); if no rocking (<2 percent) is deaired, reduce $K_{D} 50$ percent (Zwamborn and Van Niekerk, 1982). |  |  |  |  |  |  |  |
| (7) Applicable to slopes ranging from 1 on 1.5 to 1 o |  |  |  |  |  |  |  |
| (8) Until more information is available, the use of $K_{D}$ should be limited to slopes ranging from 1 on 1.5 to 1 on Some armor units tested on a structure head indicate a $\mathrm{K}_{\mathrm{D}}$-slope dependence. |  |  |  |  |  |  |  |
| (9) Parallelepiped-shaped stone: long alab-like stone with long dimension approximately three times the shortest |  |  |  |  |  |  |  |

Table A-2

| Layer Coefficient and Porosity for Various Armor Units (Source: SPM) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Armor Unit | n | Placement | Layer Coefficient | Porosity \% |
